Task 13: Add exception handling and validation to the RESTful application

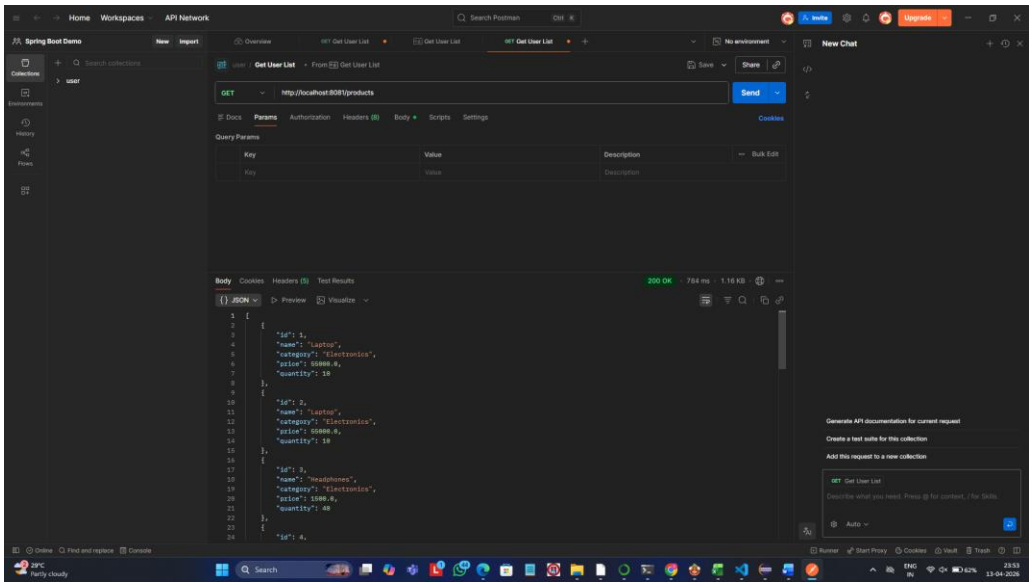
Aim

To enhance the RESTful Product Management application by adding **input validation** and **global exception handling** so that invalid data is rejected properly and meaningful error responses are returned in **JSON format**.

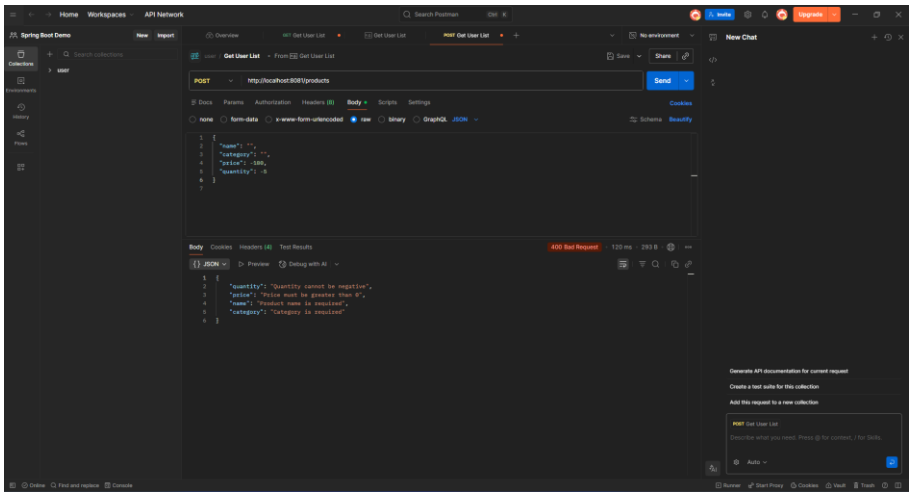
Algorithm

1. Start the application.
2. Create validation rules in the entity class using validation annotations.
3. Validate request data before saving or updating records.
4. Create a custom exception for cases like product not found.
5. Create a global exception handler using @RestControllerAdvice.
6. Handle validation exceptions and custom exceptions globally.
7. Return meaningful JSON error responses with message, status, and timestamp.
8. Test the API using invalid inputs and missing records.
9. Verify that correct errors are returned.
10. Stop the application.

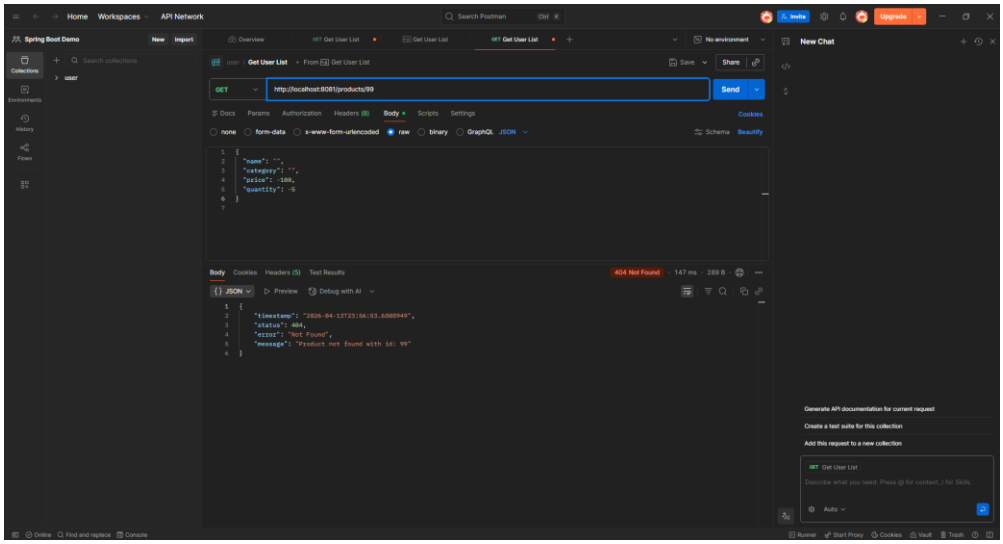
Output:



Validation Output:



Exception handling test



Result:

To enhance the RESTful Product Management application by adding **input validation** and **global exception handling** so that invalid data is rejected properly and meaningful error responses are returned in **JSON format** is executed successfully.
