Task 15: Service Registry and Discovery using Eureka.

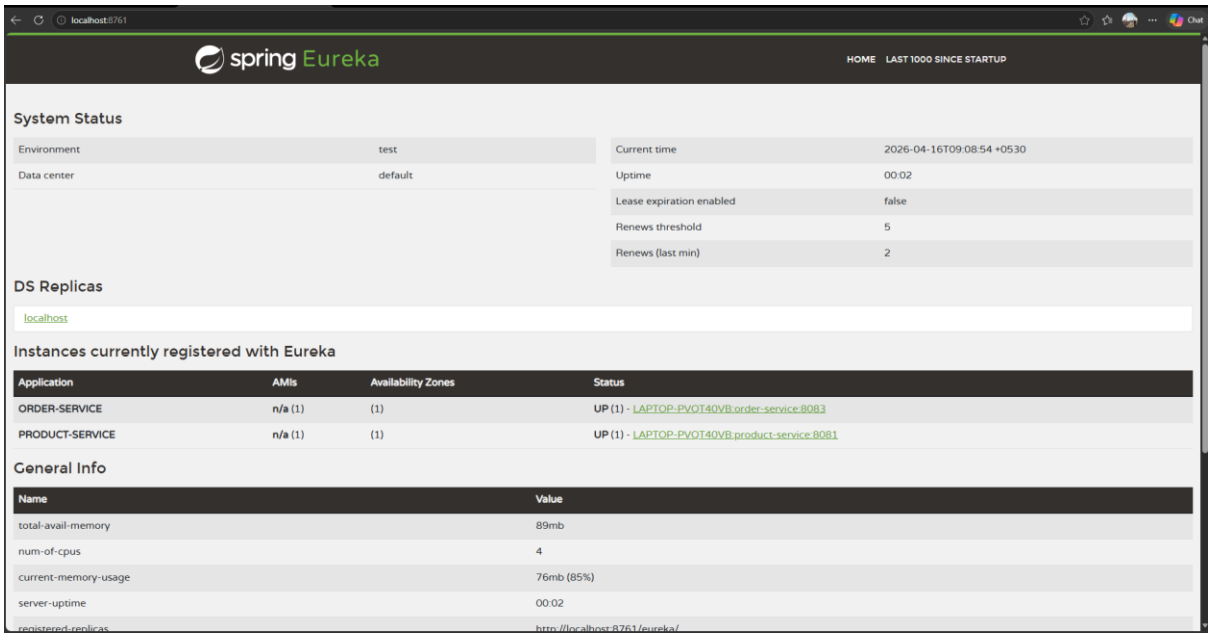
Aim

To implement **Service Registry and Discovery** in a microservices-based system using **Eureka Server**, so that multiple microservices can register themselves and discover other services dynamically without using hard-coded service URLs.

Algorithm

1. Start the application.
2. Create a **Eureka Server** using Spring Boot.
3. Configure the Eureka Server to run on a dedicated port.
4. Create multiple microservices such as **Product Service** and **Order Service**.
5. Add Eureka Client dependency to each microservice.
6. Configure each microservice with a unique application name.
7. Connect each microservice to the Eureka Server using the service URL.
8. Start the Eureka Server first.
9. Start Product Service and register it with Eureka.
10. Start Order Service and register it with Eureka.
11. Verify that both services are visible in the Eureka dashboard.
12. Replace hard-coded service URLs with the registered service name.
13. Enable dynamic service lookup using Eureka and load balancing.
14. Allow Order Service to communicate with Product Service through its service name.
15. Test the communication between services.
16. Display the registered services in the Eureka dashboard.
17. Stop the application.

Outputs:



Result:

To implement **Service Registry and Discovery** in a microservices-based system using **Eureka Server**, so that multiple microservices can register themselves and discover other services dynamically without using hard-coded service URLs is executed successfully.
